Assign PTT Function
Backwards Compatible

Turns your X10DR gateway into a vehicle despatch console

The X10DR Talkback microphone has been designed specifically to allow a user remaining in the vehicle to maintain full communications with X10DR handset users out of the vehicle while maintaining the ability to instantly communicate with others over the host radio network. To address changing priorities, the top grey Control button acts as a assignment toggle switch for the side PTT button. Press it once and the side PTT button becomes the Radio Transmit button and the status LED changes to blue to let the user know they are communicating out over the sky to the radio network. Press it again and the side PTT button once more becomes the Talkaround PTT button with the LED changing back to green to let the user know they are now talking locally on the ground (default position). Alternatively, the side PTT button can be permanently assigned to local talkaround PTT with Radio PTT function assigned to the top grey button or vice versa to mimic a wireless X10DR default configuration. In either position, all X10DR wireless and wired handsets hear both sides of every conversation. The true all informed, group communication network where everyone remains connected. See settings below for other switch configurations.

Backward compatible

Not planning to upgrade your X10DR fleet yet? Don't worry the IP55 rated weatherproof Talkback microphone is backward compatible with X10DR Elite and Pro models and the new Plus Series. Additionally, it can even be connected to an original first generation X10DR system by use of XIB-TA interface box and connecting cables. Like all X10DR devices it has been designed to meet the highest standards required by government agencies and law enforcement officers working in critical scenarios using premium quality resilient curly cables and a durable metal mobile dash mounting clip. The commercial and industrial user can feel assured that you are getting the same industrial class dependability and performance, no matter the size or type of your operation.

Emergency duress alarm capability

The Talkback microphone provides a duress button that can be used to activate the emergency mode on the attached host mobile radio. Additionally, the Talkback microphone status LED will momentarily glow RED should a connected X10DR wireless handset user press their emergency duress button. Should you desire the attached X10DR gateway can be programmed to generate an audible emergency alert so all your colleagues in or out of the vehicle will instantly know their partner is under duress and requires immediate assistance.

What's included in the package

Functions

XTBM Talkback Mic

Mounting Clip

XDIA
Dual Interface
Adaptor

XIC-0.4
